PPFAS Mutual Fund

PPFAS Long Term Value Fund (PLTVF) is an open ended equity oriented scheme with flexibility to invest a minimum of 65% in Indian equities and up to 35% in overseas equity securities and domestic debt / money market securities.

The core portfolio of PLTVF consists of equity investments made with a long term outlook and the factors considered while investing are quality of management, quality of the sector and the business (return on capital, entry barriers, capital intensity, use of debt, growth prospects etc) and the valuation of the companies. The endeavor of the fund management team is to identify opportunities for long term investments. However there are times when the opportunities are not attractive enough. While waiting for attractive opportunities, the fund invests in arbitrage opportunities between the cash and futures equity markets and special situations arbitrage where open offers / delisting / merger events have been announced. Investments are also made in money market / debt securities while waiting for deployment in core equity investments.

Foreign equity investments

The fund invests in foreign equity securities. Since investors in PLTVF look for capital investment and returns in Rupee terms, PLTVF also looks at delivering in Rupee terms. PLTVF hedges most of the currency exposure using currency futures.

Current Strategy

Economic outlook

PLTVF invests with an investment horizon of a minimum of 5 years. Since over the long term, the economic variables like interest rates, liquidity, GDP growth rate etc. can have a lot of fluctuations and in most cases see mean reversion, PLTVF focuses on company fundamentals more than macro economic variables. PLTVF does not seek to time the markets or to make top down investment strategies based on macro economic forecasts.

Corporate sector performance, valuations and current strategy

On a broader level we have seen stress on corporate performance. Sales and profit growth till March 2013 has not been as we have seen in the previous years. Various sectors are having their own pulls and pressures. Low demand for

automobiles, fuel availability and pricing for power, licensing and spectrum issues for telecom, project completion and regulatory environment for infrastructure companies, rupee depreciation for companies having excessive leverage in foreign debt are some of the examples of issues plaguing the Indian corporate sector. These issues do affect the equity markets. Our stance is to try and develop a thorough understanding of each company as a separate business and to identify companies which are not affected by these problems but have seen a steep fall in valuations on account of an overall sell off in equity markets.

Greater than one year returns are compounded Annualised Returns.

* Past performance may or may not be sustained in future.

Glossary

Arbitrage: It is a combination of matching deals on the same asset in different markets and try to lock in on those price differences in different markets. E. g. Buying the stock in the cash market and selling the future of the same stock simultaneously.

Beta: It is a number describing the correlated volatility of an asset in relation to the volatility of the benchmark that the asset is being compared to. Beta measures the systematic risk based on how portfolio return co-moves with the overall market.

Capitalisation: The total market value of all of a company's outstanding shares.

Credit rating: An independent assessment of a borrower's ability to repay its debts. A high rating indicates that the credit rating agency considers the issuer to be at low risk of default; likewise, a low rating indicates high risk of default. Standard & Poor's, Fitch and Moody's are the three most prominent credit rating agencies. Default means that a company or government is unable to meet interest payments or repay the initial investment amount at the end of the security's life.

Debt securities: Any debt instrument that can be bought or sold between two parties and has basic terms defined, such as notional amount (amount borrowed), interest rate and maturity/renewal date. Debt securities include government bonds, corporate bonds, CDs, municipal bonds, preferred stock, collateralized securities (such as CDOs, CMOs) and zero-coupon securities.

Equities: Shares of ownership in a company.

Hedging: A method of reducing unnecessary or unintended risk.

Index: An index represents a particular market or a portion of it, serving as a performance indicator for that market.

Macroeconomic: Refers to the performance and behaviour of an economy at the regional or national level. Macroeconomic factors such as economic output, unemployment, inflation and investment are key indicators of economic performance. Sometimes abbreviated to 'macro'.

Mean reversion: A theory suggesting that prices and returns eventually move back towards the mean or average.

Net asset value (NAV): A fund's net asset value is calculated by taking the current value of the fund's assets and subtracting its liabilities.

Open offer: A secondary market offering in which a shareholder is given the opportunity to purchase stock at a price that is lower than the current market price.

Sharpe ratio: It measures the excess return earned per unit of deviation. The Sharpe ratio is calculated by subtracting the risk-free rate - such as that of the 91-day T-bill rate - from the rate of return for a portfolio and dividing the result by the standard deviation of the portfolio returns.

Standard Deviation: Standard Deviation measures historical volatility. A high standard deviation suggests high volatility, while lower standard deviation would refer to more stability.
